Annotation tool Toolbox

How to set up a project, and how to gloss/annotate in Toolbox

Sebastian Drude

Excercises:

- Import at least one of the two transcribed texts from ELAN to Toolbox, using the standard toolbox **.typ** file and a custom record marker **\ref**
- Make the necessary adjustments in the typ-file for the fields created in ELAN
- Create the **\wav** field (using jEdit or another editor with regular expression support)
- Interlinearize the two transcribed texts, building the lexicon as needed
- If necessary, use the **\a** and **\u** fields
- Add the **\va**-field to the parse process (so variants would be found in parsing)
- Import the result back to ELAN

ADVANCED:

- create two databases with specific database types for persons (speaker, annotator, other involved) and abbreviations, and link them with the text and lexicon by jump paths
